Speaker 00: Okay, cool. Okay. All right, cool. So if, you know, if you are, it looks like most of you a couple and you're feeling not quite clear enough yet. No problem. We've got our staff on here. You know, Lee can engage with you on some of the content questions.

Speaker 01: The goal is to make faster, better, cheaper, more scalable work. He just finished talking about Zapier, which can be 70 of what I need. AI was integrated into it. Nan is the newest. It was, it's fabric is part of AI. And then he sort of showed a slide. The different types of workflows, agentic AI and multi agents AI, AI, intelligent workflows, human in the loop, concrete action equals prompt plus AI tool, robotic process automation, traditional and human work. And this class will only be about deployable, already built agents. Because he doesn't think there's any reason to build our own on that.

Speaker 00: Kevin stars on here as well. Our team's on here. They can support you and actually helping clarify anything you want. Direct message in the background and you know, but mostly from content perspective things. Okay, okay. So, so from that perspective, that's just a real quick overview. We talk about workflows. So the first thing we need to actually determine is which workflows do you need to or do you want to AI ify? And so I recommend this place when it comes to business applications versus just playing with tools. And there's a time for both. There's a time when I just get on and I'm just playing around with stuff and just, you know, clicking buttons and pushing things and testing it and banging on it with the team or understanding what can do and then we're pushing it to some. That's a fun part of the process and I recommend you continue to explore and be curious and have fun with the tools. But then there's a time to say, okay, cool, playtime's over in the sandbox. Now what I need to do is I need to get a bead in the company and I need to sell a product or service and that needs to now move forward. So we create a sustainable company. That's a conversation we're now the sandbox plant was in the foundations. So to do that we need to start to identify what is the workflow that you want to or need to actually AI. What do you want to actually get done? Okay, so how do we do that? How do we do that? Well, to help you do that, because I realize many of you have actually even ever done that before. I actually wanted you to start to. I want you A couple of resources and tools to do this. I posted a couple things up on the Facebook group already this morning. And the first thing I set up for you was called an automation scorecard for prioritizing your workflows. Now here's kind of the process where I'm gonna show you all this stuff. Let me go on Facebook. I'm gonna show you so you can go grab this. I built a few things for you for this that will help you start to identify what are the workflows that you actually want to be working on and how to start to put them into a workflow. How to start to think about them in terms of turning your work into a technology driven workflow. Okay, so for somebody to go to Facebook. If you go Facebook, you open the guides, of course, you'll find everything there. I'll take you there. Just a second here. Just getting it up. And where's my zoom? Here it is. And so if you go into the guide section here on the Sprint, okay, right here we will see that in the handouts, scroll way down. Handouts and goodies. I just posted this today. The workflow scorecard for session one. Okay, now if you click into this right here, I'll drop this screen. If you're not on social, if you're not on Facebook for whatever reason, we'll drop a link in here in just a moment. But you can always find it right here. Let's go right here. By the way, if you ever click on it, it doesn't pull up. Just know that you have to click away from it and click back. I don't know why Facebook does this. It's a little bit of a weird glitch. But if you just click to another guide and you click back, it should come in. So here's what it is. It is a Google spreadsheet. You shall have access to it. I posted the link. It looks like a lot of you are already there, so that's great. You shouldn't be able to edit this. You have to re save it into your own Google Drive, which is intentional, so that you don't mess with the template. And here's essentially the very simple. Because very simple bits should be very effective. And what it helps you do is it helps you actually start to think about what is the work that you're currently doing in your day to day and how do you start to determine what to spend time on to automate an AI. Now ultimately you can start automating AI everything, but you're gonna actually notice that some things are worth it. Some things are not worth it, some things are easier and some things are more complex. And so I'll go back to that in just a second. But the way we think about it around here, to start to automate an AI fi our work is what are kind of the biggest time sucks or the things that are the highest amount of repetition, that we do things over and over again. And I also look at what kind of seems to be the easiest thing to take care of. We were noticing in many articles about a year ago that a lot of automation experts were sharing some mistakes that they see their clients making. And they were noting that a lot of companies were trying to automate very complex things when they actually suggested. Which I would do is to start with the simplest stuff that's the most routine because it's simple. You may overlook it and you may think, oh, because it's simple, I should just do it. But in fact, if it's routine, repetitious and simple, you should absolutely, in my opinion, not be doing it. Why should you be doing that right now? We can certainly think about work going on a hierarchy from very simple reasoning and logic to very higher complex reasoning, logic and everything in between. For example, and this is really a, this is really a. What I'm taking you through here is not really the art of applying AI into your business. So it's not like it's cookie cutter in every area. For example, answering emails to some degree might feel like it takes a very high level of understanding or it might feel like it really doesn't. And in fact, there's two things that are going on that I want you to consider when it comes to putting AI into your business. The first thing is actually the logical reasoning. So the reasoning. Reasoning, like understand you're making a decision that seems reasonable. That's what I'll just call reasoning that for right now, it's how to make a decision that seems reasonable. Okay. In other words, a smart decision. You know, that smart decision is very simply, if I walk in the kitchen at night and it's dark, it seems reasonable to turn on the light so I don't bop into the cabinets or the island. So it's reasonable. So I make that decision and therefore my hand clicks the light and I turn it on. That's the decision making factor. But then there is another part to this which many people confuse, which is the context, the context which we're gonna talk about today as well, which is the data, the context is the storyline, my whole thing. And it turns out that Many times things that you do are actually less about the intelligent reasoning skills and a lot more about the contexts. In fact, one thing I work with leaders on, just FYI's leadership lesson, is that many times leaders feel like they're not getting providing good help. That's another thing I always hear from leaders everywhere across the world. It's hard to find good people to work with. It's hard to find good help when in fact they're suggesting that people's reasoning or logical decision making is not actually that great. But it turns out for about 99% of those complaints, if we help them increase the amount of context and understanding, the decision making capability goes way up. In other words, if you understand more about the situation, you can make a better decision. This is also a very easy metaphor for seeing. Have you ever jumped to a snap decision about something? Like, have you ever, you know, I don't know. If I see, you know, the kids doing something and I immediately snap to the judgment of, oh, you know, like, let's say, let's say my son's eating rooms or crumbs and, you know, all sorts of massive mix. So we're talking about the medium. So I walk in his room and he's eating in his room. And then if I jump to this conclusion that he is ignoring my instructions and I might get really angry about that and frustrated or start talking about that. But if I spend all the night and I have a context as well, mom actually said because we're having all these guests in the kitchen, that I should go in my room, lay down a towel and eat my room. But once I understand the context, I can make a different decision. And it turns out the decision is actually not that complex. It's the context and the storyline that supports the decision turns out to be the more valuable component. Does everybody understand that real quick? Because this is how these systems work as well. And they're designing simulation intelligence. So as we move this forward, understanding how to help them make better decisions and work with us in our businesses is very important. We get that little concept here. Reasoning versus context. Okay, awesome. Great. All right, so going back to this, this sheet here, this spreadsheet, if we dive into this and we start to score, or let's say scorecard for prioritizing our workflows, the first thing we need to do is become aware and conscious of the work that we are doing. We need to be aware and conscious of it. Now, you're probably relatively aware and conscious of what you're doing, but you're Also probably not aware and conscious of everything you're doing, or you're just so root keen in it. What I would like to do is I'm going to be giving you little mini assignments throughout these series with us because I'd like to actually start creating, moving things forward, breakthroughs, having discoveries. And so the very first assignment, I'd like to write down this. I recommend that you don't do anything you don't want to do. If you're, you know, you're gonna dismiss my recommendations, no problem. But if you would do what I asked you to do, you'll have incredible breakthroughs in the series. I would like to keep a journal this week for seven days. And I want you to pause before you do anything in your work. And I want you to write that down. It could be a digital journal. I don't write anything on my hand anymore. I have nine years. I don't want wasting paper anyways. It could be a sticky on your computer using Apple. It could be notes, it could be a notebook, it could be anything. I don't care where you write it down. Could be a Google Doc, could be a Microsoft Word, I don't care. I just want you to start to list it down. You can put it in a spreadsheet. She wants to start putting a spreadsheet. In fact, maybe this spreadsheet would be the place to document it. And so the first thing to do is actually start to become aware of what is work you're actually doing. And here's just a couple of examples. Maybe you're answering emails, okay? Maybe you're making contracts for clients, okay? And there's thousands of different activities you can be doing. So just give a couple. You'll have to start to put in your own here. So let's say you're answering email, making contracts. If you just spent a few days, starting to drop in hour by hour or minute by minute, what you're doing, anytime you shift gears and you start doing something, what are you doing? And this particular process, as simple as it sounds, just to start identifying what you're doing will start to get you better and better at understanding where to start bringing AI and automation in. And here's why you might say, oh, I'm doing marketing for my company. But marketing is a very big chunk to understand. Is that the work or is it the concepts? And many times we talk in terms of concepts instead of actually work when we communicate together. What are you doing today? Oh, I've got to. I've got to create more leads for my company or I got to meet with some people to talk about the clients or do sales today. Well, that's the topic, that's the concept, it's not the workflow. And so many times entrepreneurs are confusing workflow with concept. And so we need to start to get a little more granular because these tools are not working on concepts, they're working on more granular steps and work. And this gap for a lot of people in companies is confusing to them because they say, well, can I help me with marketing? Or you guys posted on Facebook form, what's the best tool for marketing? What do you mean? There's no best tool for marketing. That's a concept, it's not a workflow. And so these tools are working with our workflows. No, I've never said these tools, working with our concepts, these tools are working with our workflows. That means we actually start to think, what are we doing in a workflow? Step by step by step, what are you actually doing? I know we talk about being here, but we're going to set that aside in just a second. We're not really spiritualism here. We're just actually thinking about what are you actually doing? What are you actually doing with your fingers, with your computer, with your apps, what are you actually doing? And then what logical decisions are you making? Okay, it comes back to what do you have to reason? What do you have to, what's the context? And there's one more thing on here. In reasoning, in order to make a decision, we have to know what are we doing? Right? What are we doing? So in order to reason, we have to know what are we doing? What's gonna help us make the decisions? And then we've got the story or the context to help us do that. These two things work together. So when it comes to this week, I want you to start to put together what are you doing? Drop them in here and you're in the workflows now to move this to the next level, then we're start to understand where should we really put our time and attention to start to build out, you know, build AI to our workflows. And so if you're making content, hey, I gotta make content for my social media challenge, my social media channel. So I've gotta build videos for YouTube. Okay, great. So we put it in there. Videos for YouTube. Okay. And so maybe that's when your workflows. Okay, Then maybe you're like, okay, what else am I doing? Oh, I need to, I need to write emails for Follow up write emails for follow up. Okay, great, cool. What else are you doing? And just keep writing down what you're doing. Get Your list of 100 or 50 or 200 different little activities and write them down in here. From there, take some time. Let's start to scorecard them. That's why it's called a scorecard. It's going to actually help you identify where to put your attention first. Now if you just want to skip and say, okay, I got. I'm going to start working on these systematically, fine. We created this for you to give you a little bit more science behind where you put your attention first, second and third. But it's up to you how you want to use this. So we just rank things. First of all, what's the impact on our revenue, on a cost savings, on helping reduce errors or problems in the company scale of 1 to 5. One being useless, five being very, very important, one being the lowest of people. In the meantime, then we go frequency. How often are you doing this? Are you doing it every hour? Maybe you're looking tree mails three times a day, but maybe you only make contracts twice a week or once a week. And so in there you're going to be able to identify the frequency. By the way, they're going to be able to access the Google spreadsheet just to be thumbs up for people to access it. Anyone?

Speaker 02: No, actually Google disables the accessing. We can see it, but there are absolutely no menu because Google disables everything past 100 users. So to be able to download the spreadsheet, please wait for the number of people seeing it dropping. So you will be able to get it just save the link and you.

Speaker 00: Will be able to export it as a handle if you can download it.

Speaker 02: Because we can add in more.

Speaker 00: Excel sheet.

Speaker 02: Awesome.

Speaker 00: Thank you. I'm just dropping the genre right now. Sorry about that. I had no idea. I remember doing that before.

Speaker 02: I just discovered. So there's only 400 users simultaneous user for.

Speaker 00: Okay, we got to make sure we had it all. And here we go. Here's another one too. Another one. Okay, great. So now you got it. Okay, that's in the chat window if you are enabled, not able to access it. And of course VCDs in replays with a much lower traffic. You should be able to get it the right thing to do. Okay, and we got it. Now let me just take a second. Make sure we've got it before we keep going. Okay, got it. Yep. Okay, great. Awesome. Great. Okay, let's go back to the sheet real quick. Here it is. Okay, cool. All right, so we're just looking at these columns, the impact, the frequency, how often, what is the time? Don't put in the word minutes, just put in the time itself. It'll all work out in the formula. How repeatable is this? If it's low repeatability and is it able to be standardized or is it very high variability? You know, some things are super unique, super bespoke, super customizable, and those things are really just honestly tough to automate in a company. For every company. Okay, if it's super customizable, it's hard to automate. We're getting some custom cabinets built for our house and of course the guy that we call, he's like, I got a four month waiting list, man. Because we're building houses and cabinets everywhere builds houses. It's very hard to automate or scale his business because everything is custom. So it's just part of the challenge of customizing everything you're doing. In fact, we want to notice that just by the way, just starting to go through this process. I'll tell you that working with entrepreneurs, just helping them start to understand their workflows and start to decode them, helps them actually understand how they can be doing them differently to make their lives easier. So just going through this process will be powerful. Next is the data. And we're talking a bunch about data even today, so we'll talk about that. But do you have the data that you need ready? Does it already exist? Is it already ready to go? Or do you need to spend time getting it into its proper form? For example, if you are having a customer service stuff and you want to build a chat about customer service, you may need spend some time collecting that data, in which case maybe it's not ready right now you're going to spend a little bit of time actually being able to get that going. What do you say is the complexity of that? This is just a judgment call. Just 10 years. Is it really complex set of actions? Is there a lot of dependencies on other people or other things? Or does it seem pretty simple? Hey, I go in and look at my email and I get it done. For example, answer emails is pretty straightforward. Email comes in, there has to be some contextual decision making, respond to it, ready to go. Okay, out the door next. Then your automation priority is going to be basically a formula. This is a formula. You can see this is a formula right here for it. Let me see what it does. Adds up all these numbers and divides by the complexity and gives you a final number. The number is relatively arbitrary, but it is going to give you a ranking number which is going to allow you to start to prioritize your workflows. And as we can see based upon the frequency and you see what's weighted here, the frequency and the amount of effect on the business and the ability to standardize it and the amount of time it's taking up and is it ready to get automated is going to increase the priority of that. So again, regardless of whether you use a spreadsheet or not, you starting to learn about how to apply a business to understand that we are looking to apply AI to areas where it's going to increase our revenue, save us cost, where it's highly frequently taking up our time, it's absorbing a lot of our time, it could be repeatable and we're kind of ready to go with parts and pieces of the data. And it's probably not too complex. But you guys all see that that's kind of the decision making to trick you to where to put your attention on actually where do you start to go to work automating the AI, Find things cool. Great. Ask how is the frequency scored. These are all kind of judgment calls. One is just low frequency. Five. You platforms and N8N is great but exceedingly complex. But it is still considered consumer grade for entrepreneurs. So click to another guide and you click back. It should come in. It's a conversation we're in now. The sandbox playing was in the foundations. So to do that we need to start a newer approach. Right, because you're entrepreneurs, this is business applications. For those of you that are consultants or in some of our builder programs, we, you know, you're going to dismiss my recommendations, no problem. But if you would do what I asked you to do, you'll have incredible breakthrough too. Okay, great. So we might put that in there. Videos for YouTube. Okay, videos for YouTube. My video. Then I want to I correct my video. Then I want to actually produce my video and then I want to turn it into social media clips. That's at least four technologies right there. I need to record it on something. I then need to use VEED eye correction or cap cut Eye correction to recorrect it. I then need to pull it into cap cut or VEED or descript and edit it. I need to go get B roll from another system and then I need to actually maybe use opus clips and then turn it into social media or Munch zibble. And those things are really just Honestly tough to hard to automate. We're getting some custom waiting list man because we, because everything is custom. So it's just close to make their lives easier. So just going through this process with that. But do you have the data that spend time getting it in for customer service? You may need to spend some time being able to get that going. What do you say is the there a lot next then your automation priority is going to be basically a formula. This is a formula. As you can see there's a formula based upon the frequency with use this worksheet or where do you search? How is the free five is to stay the time one that we've, we've used that reorganizes your calendar. Okay, great. So we got it up to there. Now look at the next steps in here. And of course this is, this is a bigger, broader stroke. We're going to start to dive into this in detail in just a moment here. But if we look at the broader stroke, what happens after that? Well, now we have to decide do we want to focus on using standard automation? Do we want to focus on using off the shelf AI solutions? This would be like an individual product or an individual solution. Do we want to work on a human in the loop solution where we're going to actually, you know, sequence together several things And I just, I really want to make sure you guys understand the term human in the loop because it's a very important term and it's going to become very important. Now in this series of stuff, human in the loop means that you are using at least more than one tool. I mean one tool just puts it back into concrete actions or off the shelf solutions. Human in the loop means that you have got to go from one tool to at least a second tool and maybe a third or a fourth tool. Again, if we go back to this video thing, if we think about I'm going to record my video, then I want to I correct my video, then I want to actually produce my video and then I want to turn it into social media clips. That's at least four technologies right there. I need to record it on something. I then need to use VEED eye correction or capcut eye correction to recorrect it. I then need to pull it into cap cut or VEED or descript and edit it. I need to go get B roll from another system and then I need to actually maybe use opus clips and then turn it into social media or munch. That's four or five things. This is called human in the loop. Where I am actually responsible for moving the project along from tool to tools and then using the specialized tool. This is why agents are exciting, because really, although workflows can pull you out of that, they don't make as many intelligent decisions along the way. And so agents are fun because they can actually start doing this stuff for you. But I can tell you that agents are failing left and right when you ask them to do things. So it's not as exciting as it sounds. And again, there are areas I don't mean to be sounding like I'm negative about agents. It's just, it's an evolving technology and so there's certain things we can get done with them. But let's not over expect right now and we'll get into that when, when we get, when we get to agents and how they work and where they working. Great. But the human in the loop category of solutions is actually the most successful one happening right now in the world. For businesses where you have got multiple tools, you know how they work, where their limitations are, where their opportunities are. You work on one, you pull out of there, you put in another, you work on that, when you pull out of there, you put another. And before you know, you've got it done at lightning speed, but you still had to be involved in it. Everybody clear about human in the loop workflows? Just give me a big yes or no and I'll answer the question about standard automation versus off the shelf in just a second. Okay, Great. Good. Awesome. Cool. Okay, so if we go back to this real quickly here to just help you identify, so what is standard automation? Standard automation is going to really be something like, you know, make automation or zapier, where there is no AI involved at all. Remember, AI comes in when we want to make logical decisions and we want to have context helping it make better decisions. A large language model is a reasoning engine, just like the brain. And so if we need to make decisions based upon lots of inputs and make some sort of logical or reasoning decision to move forward, then we need AI. And if we don't, if it's a very simple decision, which is called an if, then if this happens, then every time that needs to happen, if this happens, then every time that needs to happen. As an example, sorry to use all these home examples, but when the clock hits 7 o', clock, our outside lights turn on. It's automation, right? Very simple automation. When the clock hits seven, the light switch goes on. When the clock hits two in the morning, because it's night, the lights go off. Very simple. We don't need logical reasoning brains to decide that. We have automation, which is very much yes or no, right or wrong. But as soon as we move past that, if it's, if there are five people in the backyard and if they're playing badminton at 8:00 clock at night, then we should turn the lights on, but only to 60%, forget it. The systems are like, whoa, I can't, I can't reason that. And then comes along, Mr. And Mrs. Chatgpt and says no problem, you take a rest, I got it. This is what I'm designed for. So standard automation is essentially anything that's really simple, that's really repeatable, that's really rule based. Yes. Thank you. As we're in our consulting course, it's a termistic rule based thinking. Essentially for simplicity, it's just rule based. If this rule happens, then that output or that change happens. Okay, I think like a switch click, then it happens. Click, it happens. Anything else, you start to move into AI. So off the shelf AI solutions would be things like. Off the shelf AI solutions are things like cloud, they're things like adogram, they're things like anything that is a built off the shoes off the shelf solution. Okay, so this spreadsheet, this spreadsheet is designed for you, to help you on this, to essentially start to go through here and list first of all to become conscious of what you're doing, to then start to give some numbers, to scorecard out to give you a priority score as to where we think you should be putting your attention. You can do whatever you want in your life, but this is what we suggest. And then to start to think for yourself what is the best type of solution that I should be using now? You're gonna get better and better at this as we go along here in this course to understand whether you'd be using off the shelf human loop or any of those workflow. We started in foundations by getting you very, very familiar with the off the shelf solutions. And as we keep moving forward into human loop solutions, some AI intelligence workflows and makes it and some agentic solutions on the platforms, you'll start to go, okay, I think I know which one I want. Head towards to get this stuff done. And you're gonna get faster and faster at it until your company is well, technologically driven, not necessarily identified, but technologically driven. Okay, so that's all I want to say on there for this particular spreadsheet. Your, your assignments, if you like assignments, is to essentially go through your workflows consciously start to add them to the sheet and start to get them up there. So you have a, like a project management system that's going to place where you can start to be working through the things you're doing and start to utilize this course for that. Now, just for fun, I actually built something else for you that I'm going to. That I put up as well on the Facebook group. And what I did is I did this. You ready? It's fun. I built a little app for you as well, if you'd like to. And the reason I built this for you, first of all, to just start to show you what we can build because you're just learning to build this stuff here. And what it is, is it's a little workflow automation prioritization platform. Whoa. Pretty cool. Now you'll find this as well. Let me see. Show this. Make sure I got up here under the Facebook group, under where did it go Goodies in my dream that I put up. Hold on, let me make sure I put it up. Go back here and maybe the team can help me if I find some pre cert. And I posted this. I saw it. This was it as well. I'm going to shout some of this to you guys in just a moment as well. This should be up in guides. Is it up in guides? It's on, guys. I think it was free when you wanted the guide. It was there. Okay, let's go back there. So real quick. If not, I'll go to that link. So what is this? This is a little app that I built to essentially do the exact same thing. Okay, so did you see it in here, Nathan? I don't get it up.

Speaker 02: Actually, no, it's not in yet, but I will add it immediately.

Speaker 00: Thank you. Okay, let's see. That says it's very easy for me to find it. Let's go back here. It's right here. I'm gonna pop it into the goodies here a second. Sorry, I must have just missed that. Real fast and moving quick. So this is gonna be the. This is a scorecard app for helping you prioritize. Prioritize your workflows. Okay, now what is this? First of all, why don't you all grab this. Also put this into the chat window and see, here it is. Okay, here it is. So go here and then back to that and there it is. So, okay, now I've been guides. You can grab that. I'll drop this in the chat one as well. I'd love to see what your experience is. In going in to actually work with that. So we go ahead and just pop on that real quick. I'll also do an open up here for you.

Speaker 02: It's already in the chat. Sorry, Ken, your the link. It's actually very good to tell everyone when you copy a link like candidate on Facebook, you will notice there are three dots in the middle of the link. The link is complicated. It's not working actually. Click on the link and then copy the. Copy the link from the URL bar once you have clicked on it. That's the way to go when you copy from Facebook. So now you know how to use links on Facebook?

Speaker 00: Yes. Thank you, thank you, thank you. Okay. And I'll put it underneath as much. Anyways, let's jump over to this. Everybody able to see that real quickly? Just make a quick yes. If you can see this workflow prioritization. What does this do? It does exactly the same thing. It's just a visual app for you. What I'll explain how I built this in just a moment. Should be relatively obvious if you look in the upper left hand corner where I built this out of. This was built in Claude code. And I'm sharing this with you because I want to start to get your appetite wet for starting to build these apps. Okay. Now you drop this in here. Basically by saying this. You put your email answering in here. The name of the workflow. We're going to just do this as a 01 to 5, you know, kind of slider thing. Impact is important. Frequency is five time per run. We'll call it 30 minutes in here. Standardization. Yes, you repeated. Sure. Four, data readiness, ready to go. Because it's that complexity and then even risk potential for issues. I think it's pretty low risk for issues. And we're going to add the workflow. Boom, it's going to drop it down here. And we now have our first workflow in here. Okay. And it gives us our priority score. The score is random, but it's used to actually prioritize against other workflows. Let's go do just another one real quick. We'll add another workflow here. We'll call this contract creation workflow creation. We'll put the impact of that at like 3 frequency of, you know, maybe once a week or something like that. It takes me only 15 minutes to get this done. And then standardization is a little bit lower data readiness, a little lower comparability complexity. Not too bad risk. Not too bad either. And we hit add workflow. Okay. Check it out now too. Look at the score, the priority score. 30. Okay, so what we're doing here is we're just using an app to do the exact same thing. If we click on View priority rankings, it now actually will put the priority rankings up here and it will prioritize what you're doing here. Okay. Pretty cool, huh? And the actual minutes that it will help you save by actually doing these. This is just a little incentivization to get you excited about what you, what you're going to save. If you actually get stuff done just to incentivize you. This tells you individually this is saving 7800 minutes a year based on that. And you know, it's not 100% accurate or arbitrary. It is here to help you start to play out your workflows. What is this? This is a little bit of an application. This is something that would have taken probably a developer maybe two to five days to get done and probably cost me about maybe 1500, $2000 for their time for the week to get it done. I actually built this in about 12 minutes. And so I'm gonna be teaching you guys how to be able to be building apps and copilots and chatbots, all this stuff so you can become builders. Because that's what this course is. That's what I want you to come out of this course. I want you to be able to become a builder. I want you to be able to start building technology for yourself, to be able to be moving your businesses along in lightning speed, because that's what the top entrepreneurs are doing. All these tools, we're building customized solutions for ourselves so we can actually move things forward for ourselves instantly. Now you can certainly use these for your customers and your clients as well. I know we have a lot of students in our consulting courses where you're working with clients and maybe building solutions for them. But that's not the focus here. This focus in this course is really for you to use them internally. So I'm not promising that they're scalable across hundreds of clients. I'm promising that you can build and use them internally for yourself. You also see there's not as much protection of privacy as you like in these things. So right now we're just focusing on how to make you a superpowered and high power entrepreneur with AI and technology, not necessarily how to be working with thousands of clients in this course, in our consultants course, in our builder courses and courses. That's where we go work on them though, so just make sure we're clear about that. For those that are Building that. Okay, so was everybody able to jump into that Claude app that we created? Yeah. Okay. Every real user at least just playlist see it. Yeah. Cool. Great. Awesome. Not bad. The little app to help us out and get those things done pretty fast. Now the spreadsheet does the same thing, is probably a little bit more useful. But notice as we start to enter data into the spreadsheet, we're also going to be able to actually connect that up to different agents and different workflows over time. So right now I've got a little, you know, wax on, wax off process going on here. For those of you that are too young for that, it wasn't predicated. And that means if you follow the process, you're going to start building interrelated webs of things that you're going to start to realize like how actually I'm building a whole ecosystem of technology for myself to get things done. A lot of examples, little assignments, and then you can do whatever you want to kind of get the bigger picture of everything. Okay, cool. So that brings us back to the original conversation. You can share the clothing. Yeah. And actually, sorry, I didn't quite completely share what went to on that thing. Sorry, I get so excited. So this is the actual. This is the actual workflow or, sorry, this is the actual app. To say this is the app itself. But actually when I designed it, it looks like this in the design. Okay, so this was actually designed and this is all I had to do for a prompt for it. Build a comprehensive app, fill this workout app for some people to identify with workflows. I'll get into this later on, start building technology. So don't go right now, but this entire little paragraph, that's it. That's all I need to create. Essentially built an entire app for me in cloud code. Now we'll take a look at some of the developer apps. You know, vive coding apps we've been coding later on here in the series. Lovable replay, polls, all that kind of stuff. It's all cool. It's got great things to. It's got some limitations to as well, you've probably heard about. But Claude code is probably the simplest. It's actually just Claude, but it's called cloud code because it's using the Claude, the code agent to build it. But you don't really need anything other than just to do it in Claude. Okay, this is in Claude. This is a scorecard app for helping you prioritize, prioritize your workflows. Okay, now what is this? First of all. Why don't you all grab this also put this, connect that up to different agents and different workflows over time. So right now I've got a little, you know, wax on, wax off process going on here. For those of you building inner religion for myself, the original conversation. I'm sorry, I guess I'm excited. So this is the actual. This is the actual workflow or, sorry, this is the actual app. This is the app itself. But actually when I designed it, it looks like this in the design. Okay, so this was actually designed and this is all I had to do for a prompt for it. Build a comprehensive app, build a SparkArt app for some to identify which workflows. I'll get into this later on we start building technology. So don't go that's it right now, but this entire little paragraph, that's it. That's all I need to create essentially built an entire app for me in Claude code. Now we'll take a look at some of the developer apps, you know, Vibe coding apps we've been around here in the series. Lollable, Replay poles, all that kind of stuff. It's all cool. It's got great things to it. It's got some limitations to as well. You probably word that, but Claude code is probably the simplest. This is. It's actually just Claude, but it's called Claude code because it's using the Claude, the code agent to build it. But you don't really need anything and then just do it in Claude. Okay, this is in Claude. Can ChatGPT do this right now? No, right now, can't do it. Basically we're going to build custom GPTs in. I'll teach you about building powerful custom GPTs in open. But when it comes to building apps and things, or let's say, I guess an app. It's not an app. It's like a interface with a little backend logic. But they just described an app. Anyways, we're going to build those in Claude. We're going to build custom GPTs in GPT. Now certainly there is a code, you got codecs in ChatGPT, but that's more to me for building the code versus actually building playable apps. Whereas CLAUDE is actually now extraordinary, I believe the Lydia hackers, I believe. Was it lovable that is now using cloud code as a background or was it replicate? Remember which ones are using cloud code as their backend? All of them. You're all using it. Okay. Okay, great.

Speaker 02: Oh yeah, Cursor, Replicate.

Speaker 00: Lovable.

Speaker 02: I'm skipping somebody. Yeah, they Have a partnership with the. Actually, that's the main. That's what Claude is doing. Instead of focusing on targeting direct users, they focus on partnering with apps and powering back coding apps in the background. So that's their main focus.

Speaker 00: Yeah. Okay, awesome. And Ransing is a replica GPT5, so you might be able to even choose the element you want or the coding agent that you want in some of these as well. And then none of these. Every single day. We only build apps, different kinds of ones, and also custom anyways. Okay, cool, awesome. So that hopefully she's gonna get you a little excited as to where we're headed. Woo. Right. But again, random build apps. Build apps. We want to build this stuff to help us with what our workflows. Okay, cool, cool. So let's go back a bit to the workflows. And now we've talked about how to determine which workflows are going to need to AI ifi. So how do we do it? Just a quick recap. We're going to essentially write down everything we're doing all week long. Then we're going to start to use these scorecards to prioritize what we're doing to understand which is the place to spend our time, just like we would as founders or CEOs of anything where there's a lot of stuff. But then we need to start to break down our workflows. Now, I realize that most people on the planet have never done this before. You never reverse engineered your work and have to then put it into some sort of technology. This is brand new to most people on the planet. And this is actually something we train our consultants thoroughly to do. You know, process mapping, value mapping companies. Now you have quite that detail for you guys. But right now, just a simplistic level. As an entrepreneur or creator, we need to start to understand how to reverse engineer our workflow so we can start to then turn it into what is essentially called a process map. Now, without getting too fancy, what are we trying to do here as the output of engineering workflow, this reverse engineering workflow, we want to understand how do we start to help ourselves use technology to do something faster, better or cheaper. That means we have to start thinking about what are the steps that I'm actually taking with each workflow. Okay. And I promise this works get really creative and also fast. But this is a starting place because if you say, hey, I need to build a, you know, I need to build a speaker kit to go more speedy, my question is, what are the steps? What do you mean Building it. Right. So we start to think about the roadmap here or what's often looks like a flowchart. And so reverse engineering your workflow essentially, is to start to be able to draw out something that gives you a little bit of a roadmap. Okay, now, not every single process has to be roadmaped. It's a creative process. Like, hey, I want to build some new content for my social media channel. Okay, well, do you want to create a workflow that takes your ideas and then builds it and then posts it? Well, that's, that's. That's a workflow. If you just want to get something done, we're in the concrete actions now. Let's just pay ritual data set. I want you guys to come into this. So if you say, kane, I need to put more content on my YouTube channel. And my question is, is, do you just want to build a video or just do videos and just. You want the AI tools to help you build the videos, or do you actually have an idea how to go through the storyboarding, how to go through the building of it for you, and how to go through the deployment of it on your channel, writing the description and everything? That's a full workflow. Notice the first one is simpler, less complex, can get done with less tools and less complexity. The second one is way more complex, has to be done on essentially a platform like Maker, and it has to be then thought out much more thoroughly. Okay, so what I want to encourage you to do is to start with a little bit of smaller systems, smaller workflows right now, and get to more advanced stuff later. If you jump into the advanced stuff, if you're new to this, you'll get overwhelmed, hands down. Okay, so let's start with as small of a workflow process as possible. That's why we asked about the complexity. Let's keep it simple. It feels too complex. Break it down to small enough parts. For example, if I said, cook me a meal, it's a big chunk. He said, wait, what's in that meal? I said, we've got salad, we've got steak, and we got fruit dessert. Okay, great. That still feels like a lot. Okay, let's just focus on the salad. Okay, great. How do we break down how a salad's gonna get created? Oh, what's in the salad? We eat lettuce, meat, tomatoes, meat, cucumbers and Mediterranean meat. Some mallows and some artichokes. Okay. And that goes into the salad. Great. Now what's the sequence that goes into it? What's the step by step to put it together. Okay? Now dad says no red nose, a glue. Freestyle down. We're going healthy. So here are some of the things you start to think about when it comes to that. You start to think about the outcome or the final output or the final results. Okay, Outcome or final result? This is ordered. And we're going to work backwards from the outcome. This is why we call it reverse engineering. Reverse engineering means you start at the end and you work backwards to the now. The end is the future, this is the future, and the beginning is now. Question is, how are we going to get between now and the future? In your steps, in your work. Okay, so once we define the outcome, we need to then start to step backwards with the steps that got us there. And if it starts to feel too complex or too big, then chunk it down or make it smaller. So if meal is too big, start with salad, and if salad is too big, start with cutting lettuce. This is one of the ways you can reduce your overwhelm. And one of the first things I get asked a lot of times is highly reducing my overwhelm on OCI stuff. The very simple answer is simplify, simplify and simplify until you feel like it's manageable. So if this work to you is like so overwhelming, then let's pick a tiny little area, like writing an email, and start to break that down. If you're like, oh, my God, that's the problem, then maybe we take a marketing campaign and we start automating it and working with it. Okay? That's the pull up to each individual person as to how much you feel comfortable about complexity. Some of you want simple symptoms, there's no problem. Some of you ready for more complexity. Either way, you're gonna need to reverse engineer the workflow. So here's how we do that. Okay, first of all, we do think about the final outcome, but there's a few things that we need to think about to put together a workflow. First of all, we need to understand what starts it, what lets you know when you need to get started. Like maybe making dinner. Get started because it's six o' clock and kids are hungry and people start saying, hey, when's dinner happening? Well, it kind of triggers the whole process. Maybe from a contract creation, a client said, I'm in, Send me the contract. Maybe an email answer comes because a new email arrived in your emailing box. Then we need to understand what are the steps, what's the sequence that's going to need to be Going into this to be able to arrive at the output. What's the final outcome? So this first three, the pretty straightforward, but you want to start to think about that. What starts this process? What are the steps to get it done and what's the final outcome that we want? This is the first three, right? Everybody okay? So far we are okay with

understanding workflow process so far, yeah. Okay, cool. Now we got a couple more things which is what context is required to make better decisions? So this is your data. Okay, this is your data. What do we need to share with somebody? And I like to think when I think about working with systems or AI findings or certain towards us, it's creative or technical. I'm thinking if I need to teach a real human being how to do this, what context or storyline would I have to share in order for that person to really understand and make good decisions? So when I work with AI technologies like lms, I'm thinking the same thing. If this was a real human, because I have a lot of experience training humans for last 25 years. The question is what would I need to tell them or share with them to help them make better decisions? And the last thing we need to consider is is this dependent upon anybody else, anything else, or is there some unique times when it's totally out of the standard? These are called edge cases and you probably heard this term before. An edge case is essentially anything that's like very one off, unique, only happens once in a while. So this is kind of these five things help me start to think through what I'm going to be doing with my process. Whether I'm building a lead magnet, whether I'm building a funnel, whether I'm building a sales thing. When I'm working on operations, I'm building member sites. It's essentially these five things. What's triggering it, what steps am I taking? What's the final output? What data do I need to help the system make a decisions? And are there any unique situations, dependencies or cases I need to consider that it needs to consider as well. All right, now, so these five things are always there. Go ahead and grab the, grab the snapshot of this. Somebody asking for the diagram again. I guess this one, which is that good. Now I know that you haven't done a lot of, you haven't done a lot of workflow analysis, which is fine if you're in our consulting course, you're probably doing some deep dives into it. But for those of you that are newer to workflow analysis, guess what? We built You a couple of. We built you, let's say a GPT also to demonstrate the GPTs. So I believe I also. No, I didn't put this up yet because I actually was refining it this morning as I was testing it for you. I wanted to test it more. So let me go into this now. Let's take you into GPTs and I built some of these things also to demonstrate what you're going to be learning to create and build. Now we're going to be just building everything, right? When I say building some things, you're going to be using off the shelf tools to build some things, you're going to learn to build your own customized solutions. The real power is in the customized solutions. But also, you know, companies that spend a lot of time, money on building great stuff, you will be able to leverage that as well. And when you combine customized solutions with solutions, you can get a really powerhouse company of what's going on. Okay, so where am I? Come on, chatgpt. Okay. And we'll just start from here. We'll start from scratch cases. This is like, where is he? This is what looks like you're out of chatgpt. Okay. Oh my gosh. So funny. Glucose energy balancing insights. This is my world right now. Glucose balancing. Okay, so I'm gonna open the sidebar here on the left and we're going to explore. All right, cool. We can explore. Now in the GPT store, you will need a. You'll need a subscription to ChatGPT. Be able to create. I recommend you get it. It is so worth it. It's insane to not have it. But anyways, that's up to you. I'm gonna go to my GPTs and we built hundreds of my GPTs. Right? All these different ones that we've issued to you guys that you have used. Yeah, yeah. All sorts of cool stuff. Okay. And there's one that I just built which is right here. Workloading powerful entrepreneurs. I'm gonna give this to you in just a momento. And what this is, this is going to be a copilot. See that term, copilot. Get used to it. There's a lot of copilot stuff happening. And we're talking about how to be building these copilots because I think you're building a ton of them for yourselves. This site is actually genius. There's a couple of silly limitations. Let's say none of this socially. They're oriented for the success of OpenAI, not Builder. It's a little unusual, but for the most part, this Site is brilliant and you should be building copilots like crazy. How many are you already building custom GPTs for yourselves? Just out of curiosity, how many do that? Okay, there's a couple of you. Okay. Maybe some of you that have already been through our courses or have been trained how to do them from us. I've seen mostly our consultants do some of this. Okay, awesome, great. You will be able to leverage that as well. And when you combine, you consider that it needs to consider as well. Okay, great. Now we got a couple more things, which is what context is required to make better decisions? So this is your data. Okay, this is your data. What do we need to share with somebody? And I like to think when I'm thinking about working with systems or AI, find things or something to work with, creative or technical, I'm thinking if I needed to teach a real human being how to do this, what context or storyline would I have to share in order for that person to really understand and make good decisions? So when I work with technologies like LLMs, I'm thinking the same thing. If this was a real human, because I want more experience training humans for the last 25 years. The question is, what would I need to tell them or share with them to help them make better decisions? Okay, and the last thing we need to consider is, is this dependent upon anybody else, anything else, or is there some unique times when it's totally out of the standard? These are called edge cases and you probably heard this term before. An edge case is essentially anything that's like very one off, unique, only happens once in a while. So this is kind of these five things help me start to think through what I'm going to be doing with my process. Whether I'm building a lead magnet, whether I'm building a funnel, whether I'm building a sales thing, whether I'm working operations, I'm building member sites. It's essentially these five things. What's triggering it? What steps am I taking? What's the final output? What data do I need to help the system make decisions? And are there any unique situations, dependencies, red cases that I need to consider that it needs to consider as well? Okay. All right. Now, so these five things are always there. Go ahead and grab the, grab the snapshot of this. Let me resting the diagram again. I guess this one, which is that good. Now I know you haven't done a lot of, you haven't done a lot of workflow analysis, which is fine if you're in our consulting course, you're probably doing some Deep dives into it. But for those of you that are newer to workflow analysis, guess what? We built you a couple. We built you, let's say, a GPT also to demonstrate the GPTs. So I believe I also. I'm not even put this up yet because I actually was refining it this morning as I was testing it for you and I wanted to test it more. So let me go into this now. Let's take you into GPTs. And I built some things also sort of demonstrate what you're going to be learning to create and build. Now we're going to be just building everything, right? But when I say building some things, you're going to be using off the shelf tools to build some things. We're going to learn to build your own customized solutions. The real powers in the customized solutions. But also, you know, companies that spend a lot of time and money on building great stuff, you will be able to leverage that as well. And when you combine customized solutions with office solutions, these should be a really powerhouse company of what's going on. Okay, so where am I? I'm on ChatGPT. Okay. And we'll just start from here. We'll start from scratch. Case, this is like, where is he? This is what it looks like. You have chatgpt. Okay. Oh my gosh. So funny. Glucose energy balancing sites. This is my world right now. Glucose balancing. Okay, so I'll open the sidebar here on the left and we're going to explore. All right, cool. We'll get to Explorer. Now in the GPT store, you will need a. You'll need a subscription to ChatGPT. Be able to. Recommend you get it. It's so worth it. It's insane to not have it. But anyways, that's up to you. I'm gonna go to my GPTs and we build hundreds of my GPTs, right? All these different ones that we've issued to you guys. That you have used. Yeah, Y cool stuff. Okay. And there's one that I just built which is right here. Orthodox entrepreneurs. I'm gonna give this to you in just a momento. And what this is, is this is going to be a co pilot. See that term co pilot. Get used to it. There's a lot of copilot stuff happening. And we're gonna talk about how to be building these pilots co because I think you're gonna be building a ton of them for yourselves. This site is actually genius. There's a couple of silly limitations, let's say not the socially they're oriented for the success of OpenAI not builder's a little unusual, but for the most part this site is brilliant and you should be building copilots like crazy. How many are already building custom GPTs for yourselves? Just out of curiosity, how many of you that. Okay, there's a couple of you. Okay. For some of you that have already been through our courses or have been trained how to do them for us, I'm seeing most of the rinse of these two singles. Okay, awesome. Great. Okay, no scary. Okay, great. Awesome. Okay, thanks. Your courses. Okay, great. Awesome enjoyment. Yeah. Actually Mark, there is some funny, funky stuff going on with GPT5. In fact, it's not unusual that I set our custom GPTs to 4.0 when I work with them. They seem to be a little bit more stable in 4.0 with these. So you might set the 4.0 and then go all those back to 5. Anyways, this is a little workflow copilot. Let me give you a link in here. Although I've also put this up on the, on the guides itself. So right here you get it right there, there's the link team. Maybe cavernous open. You guys can just confirm that I did put it up on the guide section. I was stuff today. And Chelsea is noting that GPT5 is getting really sassy and stubborn. Yep. And it's getting a little. It's getting a little wacky and weird, but it's scared. They're tweaking and changing and training and we still want to be grateful for the fact we even have it. Saving us tremendous amount to me for saving us a lot of time on here. You'll see it's pretty straight straightforward. This is a workflow engineering compilot for entrepreneurs. Now if you're a consulting course, you got a separate one that works with you to help you work with clients. It's a little different. You can see what it is. It's a gtk. A copilot helps professionals deconstruct many warflows and rebuild them into smart, automated and hybrid AI systems. It designs actionable blueprints using make and abandon and deploy identity platforms. Cool, right? So this is going to basically be your copilot. I'm going to teach you how to build copilots on this session. We'll build up to them and we'll get to those. I'll show you how we build pretty advanced ones here. But what a copilot is anything that's going to work together with you in collaboration to help you move through things. And I said this before about this data again, just so you keep getting drilled in, is that copilots are a structured experience. So I've designed this as a structured experience to take you through this and assuming it follows its instructions, which it mostly does but doesn't always, it should actually help you step through this in a very structured way. Let's give it a gander and see how it will go. I was tweaking this morning because I built this a while ago but I wasn't super happy with the way it was acting this morning. So let's see if it will act accordingly. First of all, you'll notice I do actually print 40 since we still have that capability. I find it to be a little bit more. A little bit more, let's say successful with this. But in fact it's actually totally going off guilt as. Okay, all right. So this is also. I have to keep tweaking it. Let's put in five ones if it attacks any differently. Let's do one more time here. We'll do the chat and see. Help me reverse engineer workflow. Ready. Let's see what it does. Notice when we put in five, it starts doing some thinking and it starts to read the documents. Takes a little bit more time to do all that. It's a little bit more thoughtful. So give it just a second and let's see. Okay, that one's work a little better. Okay, we have to tweak it out 4 or 5. Let's lock into one high impact lane first. Which area you want to start with? Marketing, sales, customer service, productivity, admin, finance, legal or another. Let's make it really simple for the demo and we'll just say customer service emails. I would like to aify this to save me time. Now we'll see how much we go through on this demo. But you'll see the copilot. Use yourself product customer service meals and prime chargers. Engineering your performance intelligence system 30% okay. Customer experience sounds phase one version of your current workflow. See, let's break down what's happening right now before we automate it. Now please note something right now which make this note right now. Ready? What you are doing right now may or may not be the most effective thing. This is a very important risk to what you're creating. I just want to mention it right now. Okay? That means that you what you're doing right now, how you're doing things. If you automate your AI what you're doing, you're going to automate your AI for what you're doing. It doesn't necessarily mean that strategically doing this right thing now this course is not designed to go through all the different strategies in your company. But just keep that in mind that you might want to always seek out am I doing the best practices with this because if AI finds you automate what you do, you can speed up something that doesn't work very well. In fact it's often safe. If you take much idiots you motivate them. When you get you get motivated idiots. In other words, automation just speeds up things whether it's being done right or not. Okay so just keep that in mind as we go forward. This okay so import sources where your customer emails come from Category inquiries Common examples Responses to twin bread Escalation logic response time expectations that is supposed to be asking you one question at a time. So it's failing its instructions which I was tweaking it and for some reason it just doesn't want to follow its instructions. So I will repeat this out for you but essentially for now if you want to go through this if you answer some things like where your Let me give you a very general thing to go for. So I receive emails on Gmail and then I need to come up with a proper response that follows company guidelines and FAQs and then respond via my Gmail. Okay, now let's see what does all that. There were all of its questions and all this different stuff like automation text tags like that I just described it Workflow Receive email read, interpret, search for information write, reply, send and track what is this? This is this. This is what I was showing you here. This is what it's doing step by step. Oh, first step is number one receive email Number two read and understand Number three respond and reply. It's actually building that whole thing right there for you. Okay so let's go back to it. Future workflow AI assisted here's the re engineered version that saves you 79% of your time email ingestion classification Gmail connected to make.com or Zapier to auto forward incoming messages to an ad processing module. The AI module could be any of the GPTs or Geminis whatever you choose, Claude, whatever you're going to then send the name any tags check the sentiment the emotion of it Dynamic prompt construction the system full of custom prompt feature email content Holy cow brand voice Then you're going to use the base prompt AI generator Reply continuous learning text acts Holy moly. Now some of you are looking at this, you're going I'm already overwhelmed. Right. How many of you Just had that experience in just looking at that simple AI automation. Right. They got that. Great. So what I just jumped into was an AI intelligent workflow using make automation. Okay. Now I will tweet it because I actually designed it to actually give you a simple one, human loop one and then the AI automation and then the genetic one. So it is simply not following the instruction sets. So give me 24 hours, I'll go to work on it and get it back up to you. But the point is, is that that is the more complex ones and that's why I want to save you. Let's start with the off the shelf and the human loop work because it's gonna actually go much faster, you're gonna understand it and it's gonna work much easier. Okay. Does ROCK fall into any of these applications and LLM? Sure. I mean ROCK is an LLM and you can use it. So yes, it does. If you would like to enjoy says yes, asking me one question at a time, that's great. So you can go and play with it. It should be asking everybody and acting same for everybody. Obviously it's not

here, so I'll tweak it out. But the idea this is that you can actually go in there, explain to it what you're trying to get done, and it can guide you through the process of thinking through what you can be using as an off the shelf solution. Human in the loop workflow on make or zapier or any den or agentic tools that are ready to be deployed. So I asked them to do those four things for you. Of course click on doing it, but we'll find you out in the prompts where it's not working and it's gonna give you solutions. Off the shelf, doom in the loop workflow, platforms and agents, just suggestions. Then ultimately you need to go and make it happen. Why do you need to make it happen? Because you're interacting with a large language model and a large language model can only help you think it through. It doesn't have any hands, its hands are tied behind its back. It can only describe to you and help you think through the process. And then somebody else, either you or an agent, needs to go and do it. What you're see is when you sign it to an agent, very often it's going to fail. So there's more human in the loop work that you'll be able to get done. You go from reasoning it to human loop work and then you'll start getting these things done. Okay, let's do it piece by piece. So what we're doing right now is we're starting to understand how do we break down our work into little bits and pieces. I'm. So you want to see the instructions again? Sure, I can show you that here. Okay. Checking it out. We'll go back up and we'll see what it says. So basically gave us the. So this is not. This is a very, very reasonable workflow. Five steps. Right. And what I will tell you is that unless you're going in now, is there an easier solution, I don't even know an easier solution than what this one suggested to you to be able to go and get your email to be responded to. Yep. Okay. While you're shaking your hands. Absolutely. First of all, if you're in Gmail, Gemini is a source to be able to get this stuff done for you as well. Right. Okay. Yeah, you can use sanebox as well. It's an off the shelf solution. Right. Gemini would be a concrete solution, off the shelf solution to get that done. This is actually putting you right into a workflow on make. Notice it says zapier or make because they are essentially interchangeable. Whenever I say zapier you can think make. Whenever I say make, you can think zapier because it's two or three. Notice it doesn't reference any N because that's a whole next class level for complexity. Right. Why don't you familiar with these terms and familiar with these platforms? Right. Okay. Generous documentary. This is a huge first to do for help desks. That's right. And now we can get them like this. So it says step one, how to get the email ingested in classified. Step two, how to get a dynamic prompt instruction to help the system understand how to respond to the email content. And then it says your company guidelines and FAQs. These are reference documents for embedded knowledge basis. This is where we go right now. So hang on to your hats. That's just a scam through. The rest of step three is to generate the generated AI reply. So Genai is going to. The NLM is going to draft an email in tone and compliance and it's going to do this. It ensures you stay in control of the AI design of the work. And then it's actually set to do the LLMs generate right now. So now we can get it done like this. So it says step one, how to get the email ingested and classified. Step two, how to get email content. And then it says your company guidelines and FAQs. These are reference documents for our embedded knowledge basis. This is where we go right now. So hang on to your hats. But just to scan to the rest of step three is to generate the generated AI reply. So Genai is going to be. The NLM is going to draft an email in tone and compliance and it's going to do this. It just ensures you stay in control while the AI is 90% of the work. And then it's actually set up a learning system so it can fine tune your actual voice and decisions over time. Wow. It wants you to set up a vector database like Pinecone and Chroma. Holy moly. That's pretty complex. And then the text stack is all summarized here. Your Gmail inbox, your LLM model, your knowledge base, your middleware, which is the stuff that's actually automating the whole thing. Your output, Gmail drafts and then optional add ons or additional databases. Okay. And then there's an advanced upgrade. So if we break it down, you actually probably will be able to start to understand step by step. And one of the things that I suggest to you by the way is first of all just start to slow everything down. Everything feels overwhelming. My 6 year old son is now starting to drive, just got his license. So Louie's a wonderful driver actually because he actually was flying planes towards him. So he's pretty advanced with managing large machinery. You know, still can get overwhelming. You get a lot of traffic, people merging around you and you're new. So I would say to him if it feels overwhelming, just slow down. That's it, just slow down. Everything will slowly dewelm because you can take in more when you're moving a little slower, taking it step by step. Okay, now we're coming back to that down the road, but let's start to move into the next area. I'm utilize every minute we got here to get some more minutes. So I'm gonna utilize the next area that's gonna start to help us stack. Okay. And I do promise we'll go a lot of creative areas in this whole series. I know this is a little technical today, but this is gonna be the starting places to get us to what we need to get everything done in different areas. Okay? So the next little thing I want to talk about, which we won't probably get through all today, but we'll continue next time, is data. So you're gonna see that in every workflow and everything you do, everything you do with your systems, every chatbot, every agent, every AI workflow, every image generator, every video generator, every large language model, reasoning prompts that we give to help us with our company. It's going to need your data. Now, some of you have advanced data structures with us and things, but this is really about your company data, okay? So we need to start getting you to start capturing, understanding how to be preparing your systems with data. Okay? Now what is data? Why is it important? Well, your data is the fuel for all your business decisions. So if you want these systems to be making better choices, giving you better recommendations, because guess what, ladies, gentlemen, chatgpt or Claude or anything, they will give you absolutely confident, confident direction and advice that is 100 mediocre wrong. It'll happen all the time. So part of what makes it better, because if it's going to, I mean, it's, it's pulling from trillions of data points of data. So it's going, look, man, I got trillions of data points. I got satellites, you know, circling around the earth, like, what do you got? Right? And so it can pull from this data, but it's going to be general data, and it's going to be data from everywhere, all the time. So if we wanted to get much more specific and accurate to do things for you and your company in the way you do things, we have to start fueling it with your own data. Okay, if you don't collect it, then it's guessing, and you are guessing. It's gonna help you make much better decisions and make much more personalized everything even to interact with your customers and clients. And if you're not collecting data so you can make better decisions, not just you, but also the systems, if you're not really cleaning it properly, then you're gonna be guessing wrong because you're looking at extraneous or wrong data. Okay? So if you don't collect it, you're guessing. If you don't properly organize it or clean it, you'll be guessing wrong. And if you don't analyze it, you're letting everyone else around you outrun you. And the same thing for your AI systems. It doesn't matter that you're using all these tools. If you're not properly feeding with the right data, then you're essentially guessing, potentially guessing wrong and letting everybody else in the entrepreneurial ecosystems run faster than you with better decision making. Okay, why data so important? If you do, just make a quick yes in the chat window so you know what I'm talking about. All right, great. So let's talk about different types of data. Okay? This is entrepreneurial approach, but every entrepreneur and every professional in the world needs to be Thinking about how they're using their data in their systems. Okay, so you got your data. Okay, you got your data. This is data that you're extracting from your processes and your stuff all day long. This is your stuff every time you make a move, every time you have a meeting, every time you think about something, this is your data. All of your customers in your contact database, that's all your data. But then there's everyone else's data, there's other people's data. And you can actually use a data scraping process to be also training your systems on other people's data. Just need to be a little careful about that, that we know what we're feeding it. But certainly if we want to be extending past our own data, we can be using other people's data. So it's a little like money. You got your money and you got other people's money. How many of you like other people's money? Opm. Who likes opm? Other people's money. Yes. Very good. All right. A lot of you, of course. Right? And of course, as we've seen, if you have been around the world a little bit, you're even listening to Robert Kaki for 25 years saying things over and over that most people who adjusting about their own money are limited in their investments and builds really wealth because it actually expands when you can deal with other people's money, because there's a lot more other people's money than there is your own money for everyone. Even for Branson and the non monster and everything, if he was combining all the billionaires in the world, he'd have a lot more resources than just his own. So it turns out that actually other people's data and data out there is actually much more mundane than your own data. But it's all important because your own data has a very special quality to it, which is yours. It's how you work, it's how you like to think, and it's how you like to act. So let's consider the data spectrum. Okay, first of all, there is unstructured information or data. For example, let's call this YouTube. YouTube. A whole bunch of unstructured bunch of people just yapping about a bunch of stuff. What's around their mind. Yap, yap, yap, yap. Then there is structured data, like a class, like a course. Now this is just a metaphor, but in fact, every area of your business, there's just a bunch of stuff. And then there's you organizing it, structuring it and cleaning it, which do you think is better to feed into your chatbots, clones, agents and AI intelligence systems and large language models? If you had to take a really structured guess, which would you guess?

Speaker 02: All right, beautiful.

Speaker 00: Yes. So just note that you just grabbing information and numbers or meetings or anything and just slam it into your chatbots and your AI tools. You're going to simply destroy them or make them a mess, your co pilots and things like that. Okay. And so we want to actually spend a little bit of time structuring your data. I'm going to give you a very, very simple ways of doing this at this level. And for most of you, we don't need to be overly data oriented scientists. And I say that this little jab to the lady because she is essentially an extraordinary data wonder of the world. She's the eighth wonder of the world. It comes to data. In the meantime though, we just need a handful of little key, let's say concepts and we can make sure that our AI systems are performing really top notch. Okay, so this is not, if you're a data scientist, go la la la, because you'll get angry. But this is for the entrepreneurial world. We say, ah, good enough, let's get to the market. Right, so the data preparation process real quick here is very simple. We're going to extract it from some source. I'll talk about what those sources are in just a moment. We're going to scrape it. Notice scraping. Maybe you're not really familiar with the term scraping. Scraping is essentially when you copy things off of anything. You take your cursor and you scrape it. You highlight all that content. Imagine you went to a great health blog and they wrote this great article. Or you went to a YouTube video. Like, I just love the way this person says that. You went to the transcript, you just highlighted everything. You just hit copy. This is called scraping it. You'll see you got a great email. Oh my gosh, I love that. I want to model any email. You just want to use scraped that email account copy, hold it down. You just copy everything highlighted in blue or whatever colors on your screen and you hit copy. That's called data scraping. There are actually AI tools that can do it in mass. And so, for example, I train the state conglomerates. We actually can show the teams how to data scrape off the MLS systems where thousands of houses are going up every day and they want to be scraping all of that. Maybe you want to be reaching out to all sorts of business groups, all of the community groups in your area, or all of the what's the business community groups always get together what they're called Chambers, Congress. Right. Let's say you want to data scrape all of them. Well, you can use the AI tools and agents that can go out there and they can go search all these websites and scrape all this information. How do you think agents work when they go research 200 sites? Well, they go crawl and they basically scrape all this information and then they bring it in and they process it through the LLM. That's why agents cost more, because we have a lot of processing of tokens. Right. Crawling, scraping, indexing, all that kind of stuff. The scraping tool name. Well, there's a couple actually. Was initially in our last one. I'll pull these up real quick here. Let's see. Here's ethical data scraping. Let's find these. MLS scraper. Pull these up for you. Emily, if you would also maybe so kind to help us pull up the data scraping tools we typically recommend. But I have them here. There's a couple of them. I'm missing more too that we want to show what it is to be able to sensitize. And we'll get into these as we go. Different things. So here's a scraping data scraping tool. It will go scrape all over the place. It's called scraping solutions.

Speaker 02: We use a browse AI usually and chat for data also.

Speaker 00: Yes, chat for data. For data.

Speaker 02: With a foreign chat for data AI. It's in the. It's in data. Yes, usually solutions. We use a browse AI usually and chat for data also. Dropping in the chat for data. We use a browse AI usually and chat forms. We use a browse AI usually and chat for data also.

Speaker 00: Yeah.

Speaker 02: Yes, for data.

Speaker 00: It will go scrape all over the place. It's called scraping solutions.

Speaker 02: We use a browse AI usually and chat for data also.

Speaker 00: Yes.

Speaker 02: With a. For chat for data AI. It's in the. It's in the. It's in the.

Speaker 00: Thank you. Okay, thank you. Great. Anyways, these are the other ones. Browse AI and we'll do chat for data. Anyways. These are. These are data scripts. Data and I believe chat for data. Anyways, these are. These are the other ones. Browse. AI and we'll do chat for data. Anyways, these are. These are data scrapes to chat for data. And I believe Chat for data has a. It has an extension that you can plug in as well to your chat for data. There we go. There it is. You can plug an extension. Yeah, you can have it to Chrome and we have iPad in here for A while different computers or you can use this to scrape. So these are some great data scraping systems. They work differently. And you know, data scraping is a class as data scraping. Legal. It's absolutely legal. You're scraping data. It's how you use the data that becomes more important around the ethics and legality of things, working with data. But these are all legacy. This is called ethical web data scraping. This is all ethical. You can use all this. This is the MLS scraper. Collect data properties up and so forth. Here's another data scraping tool, Bell Delta data scraping. You see lots of companies are using it. And this is browse scraping data. You see lots of companies are using it. Here's another data scraping tool. You see lots of companies are using it. And this is browse scraping data, right? All this kind of stuff, they're all using it. It's how they're using it is determining the ethics and the appropriateness of how using it. But you can also very simply just go and just read something or you can download it or export it as a PDF. Either way, you're extracting some sort of data. And remember, there's your data and then there is other people's data. But then we need to make sure that it is relatively structured and organized. And that starts with cleaning it. Now, for all things and purposes, just to be really simple, cleaning it will just look at eliminating completely noise or erroneous information. So for example, if you have a meeting on your Zoom and you start the first five minutes chatting about the weather, chatting about your recent trip to, you know, Disney World and how, you know, kids these days are, you know, so spoiled because they think everything should happen in this event because they get my conversations. But if you have those conversations and then you go into your business meeting, that first five minutes is considered noise. It's not important. And it should be edited out or gotten rid of. And we'll keep looking at this as we go. Kevin asked, are there any data cleaning tools? And Libby gives a big laugh on Q. Okay, we're the laugh. There it is. Okay. No, there are no good gen AI data cleaning tools. I can do that quickly. Another time I might plug it on here, but we'll come back to that. And then if you really want to get into, we have to organize it and start to label it. This helps the AI technologies understand what it's looking at. Organizing it and labeling your AI data or data really starts to structure it. And so for all this purpose, just keep it very simple. If you extract data, you make sure we get rid of any of the noise duplicates or irrelevant information. And then we just make sure that if we handed that to mom or dad, they knew what the heck you're handing them. What are they looking at if you just handed it. And I always do the mom test, but I got this from building video games back in the early days. We had a very large video game developing company where we were developing video games for women and for children. And so the test was give it to your mother or your mother in law because she's always more difficult. Give it to your mother and ask her if she understands how to play without hearing any instructions. And I realized it's actually a really great way of thinking about it. If it just handed this PDF of this document to my mom, would she even understand what she's looking at? And if not, it's probably not the best thing to hand to an AI either because AIs are not likely to be like mom to look at you and say, I don't understand, what is this? What are you hanging about? I'm confused. But they're like, I say it's great, thanks so much. I'll start making deductions and analysis for you. But it doesn't actually know what's going on. And so we need to make sure that we are understanding, working with a hyper intelligent synthetic intelligence here that is just going to run with stuff whether you've done a good job with it or not. So we want to market it, we want to label it better marketing statistics. From October 1st to October 30th, the show rates of people at events. Event number one, event number two, event number three, show rates. It's gotta be clear otherwise we're feeding unclear unstructured information to the AI technologies. Okay, last slide. In that promise, I'll let you over the day here, take a snapshot of that. We will circle back around to these things. We're keep using them day by day by day here. The last thing is what are the different types of formats? You know what, all right, I'm pause here. We got actually more slides left. I got four more slides. Let's pause here. All right, I'm going to pause this. What are the different. We'll circle back around to these things. We're keeping them day by day by day here. The last thing is what are the different types of formats? You know what, all right, I'm going to pause here. We got actually more slides left. I got four more slides of this. Let's pause it here real quick. Just looks like an hour. Here he is. All right, let's pause it here. Can we come back next time? We'll finish off with the data conversation and we'll start looking at everything we talked about today. Starting to get into the building of things and starting to put it into building custom gbts, starting to build into apps and starting to get things that can help us. And then we'll start moving into creative asset building as well. Oh, and, oh, reasoning. Actually, I got all the.
